Infrared Lamps for Horses for Improved Muscle Blood Circulation

Our company offers infrared lamps. The infrared rays emitted by the infrared lamps for horses promote better blood circulation in the muscles. This improvement in muscle blood circulation enhances the removal of waste products from the muscles, reducing the likelihood of injuries in your horse. The generated infrared heat from the lamps ensures that blood sugars are absorbed more quickly by the muscles. It also facilitates the faster removal of lactic acid from the muscles. For these lamps and many other equestrian products, you can turn to us.

Place your order now

Are you interested in these infrared lamps for horses? Or are you looking for other items, such as a horse treadmill or other training equipment? If you have questions about the shipping and return of ordered products, we are also happy to assist you.

- Long lifespan
- More heat
- Better blood circulation

Features

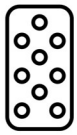

Why does the lamp have a longer life?
The reason why conventional lamps only last for 1 month continuous operation is that they cannot withstand the generated heat. Our lamps are constructed in such a way that they can withstand the high heat. The life of our lamp is equal to that of the filament. These lamps can burning continuously for 6 months without breaking.

Why does our lamp generate more heat?
Because the filament is placed exactly in the middle, the heat produced blasted properly.

Why does our lamp not fall out of the socket?
The basic problem in letting go of the lamp off the fitting is that the glass is glued to the screw part on the lamp. This glue burns and the lamp falls. As it is said our lamps are glued through a super glue this is a lame excuse and not the correct

one solution. No glue is used in the production of our lamps which is the problem of falling lamps. In contrast the base of the bulb shaped with screw threads and the steel part is screwed onto the lamp. So there is never no more problem with a falling lamp
