Turbo concrete NL is available for firmly securing posts, pickets and other items in the ground, without having to mix them beforehand. This dry, fast-setting micro-concrete mortar makes it possible to fix within approximately 2 minutes, while the mortar hardens completely after approximately 15 minutes.

Turbo concrete has been specially developed for use without prior mixing with water, although it can also be mixed if desired. This rapid concrete mixture is particularly suitable for firmly anchoring posts for fences or signage.

The Turbobeton NL mixture consists of a homogeneous combination of sand, fine gravel, special binders and additives to improve the properties of the mortar. The binders include aluminate cement and Portland cement according to EN 197-1, while the aggregates consist of sieved and reconstituted sand, as well as gravel 0/10 according to EN 13139, EN 12620. Specific additives are used to improve the workability of the mortar, resulting into a powerful and reliable solution for various anchoring needs.

It is important to note that Turbo concrete NL is not suitable for construction purposes such as foundations and floors.

- Fix in 2 minutes
- Without mixing
- Water-resistant bag
