IRRIGATION

TREADMILL

Dust development is a well-known issue in riding arenas. Low humidity and intensive use of the ground quickly lead to swirling dust and sand, creating an unstable surface. Training under these conditions is unpleasant and unhealthy for both the horse and the rider.

A regularly irrigated riding arena significantly prolongs its lifespan and provides a better riding surface/track. Q-Line® utilizes special sprinklers in its systems, evenly moistening the riding surface through proper misting. Your riding arena will be durable, dust-free, and smooth with a Q-Line irrigation system.

The Sublime pop-up irrigation system comprises a complete setup operated by a programmable rain computer. Upon purchase, all necessary components for installing this irrigation system are included: hoses, connectors, clamps, Teflon tape, adhesive, nozzles, and 24V electric valves. Additionally, a clear 3D manual is provided, illustrating how the parts should be assembled. You can easily connect your own pump to the system using the supplied 1" adapter.

- High-quality nozzles
- Extremely robust
- Easy operation
- Nozzles fully adjustable 50-360 degrees
- Improved waste water tolerance

#### **Features**

Permanently installed pop-up sprinklers are typically positioned alongside the track. Optimal placement ensures even irrigation across the surface. These sprinklers are controlled by a specialized system.

The riding arena is sprayed multiple times based on the number of electric valves, considering water supply and pump capacity. The operation is entirely programmable.
